STC Data Analyst Project – Week 1 Report (FINANCE INDUSTRY)

1. What do you understand about the problem?

The business has seen a steady rise in customer complaints across several service channels. This trend may point to deeper issues in product performance, service delivery, or customer support processes. If these problems are not addressed, they could lead to increased customer churn, lower satisfaction levels, and damage to the company's reputation and customer trust.

2. Who are the stakeholders?

The stakeholders are the individuals and teams who will use or benefit from the insight generated from the analysis. The following teams and departments will benefit from the insights generated through this analysis:

i. Customer Service Team

The customer service team will use complaint trends and patterns to improve response quality and staff training. By understanding common customer pain points, agents can respond more effectively, resolve issues faster, and improve first-contact resolution.

ii. Product Managers

Product managers will use the findings as customer feedback to identify and address product-related issues. Understanding which features or services attract the most complaints will help them prioritize improvements and enhance overall product performance.

iii. Operations Team

The operations team will rely on the analysis to uncover inefficiencies in internal workflows. These insights will help identify delays in complaint handling and improve coordination across departments to speed up resolution times.

iv. Compliance and Risk Department

This department will focus on monitoring high-risk complaint categories, such as fraud or data privacy concerns. The insights will support regulatory compliance, reduce risk exposure, and help prevent potential legal issues.

v. Executive Leadership

Executive leadership will use high-level insights from the analysis to support strategic planning and resource allocation. This may guide decisions around staffing, technology investments, and broader customer experience improvements.

vi. Data and Analytics Team

The data and analytics team will use the findings to improve data collection, tracking systems, and reporting processes. Their goal will be to enhance data accuracy, increase automation, and support future predictive analysis.

3. What questions should this project answer?

This analysis aims to answer the following questions:

- i. What are the most common customer complaint issues?
- ii. Which products receive the highest number of complaints?
- iii. Which complaint submission channels are most frequently used?
- iv. Which states record the highest number of consumer complaints?
- v. How have consumer complaints changed over time?
- vi. What are the most common company responses to complaints?
- vii. How effective are companies in providing timely responses?
- viii. Which products have the highest rate of untimely responses?

4. What insights will help solve the problem?

I. Customer Behaviour, Trends, and Patterns

The analysis will identify when complaint volumes increase and what may be driving those increases, such as seasonal trends or product-related issues. This helps reveal whether complaints are isolated incidents or part of an ongoing pattern.

II. Recurring Issues and Root Causes

The report will highlight the most frequent complaint categories and trace them back to their underlying causes. This allows the business to move beyond resolving individual cases and focus on fixing broader systemic issues.

III. Channel Performance and Efficiency

The analysis will assess which service channels, such as phone, mobile app, or web—generate the most complaints and how efficiently those complaints are handled. This will help identify where customers experience the most delays or dissatisfaction.

IV. Response Efficiency and Service Performance

The report will measure how quickly complaints are acknowledged and resolved compared with expected service standards. This will show how response times affect customer satisfaction and retention.

V. Operational Gaps and System Bottlenecks

The analysis will identify stages in the internal process where complaints are delayed or unresolved for too long. These insights can help improve workflows, allocate resources more effectively, and strengthen cross-team collaboration.
